

Nachtrag zum Laufkäferverzeichnis von 1952. Verh. des Vereins f. naturwissensch. Heimatforschung zu Hamburg, 31. Stade. — MAKOLSKI, J. 1952. Revue of Central-European species from the Badister bipustulatus Fabr. group with description of a new species (Coleoptera, Carabidae). Annales Mus. Zool. Polonici, XV, p. 7–23.

**Notes on some Fulgorids collected in Canada by
professor Håkan Lindberg during the summer of 1956
(Homoptera, Fulgoroidea).**

P. KONTKANEN

(Zoological Museum, University of Helsinki)

In the summer of 1956 Professor HÅKAN LINDBERG went to Canada for the X International Congress of Entomology at Montreal on August 17–25. Before and after the congress he was able to collect insects for a few weeks in various localities in the Provinces of Quebec and Ontario. I have been entrusted with the task of identifying the fulgorids collected by him. As the material included some additions to the publications by MOORE (1944, 1950) on the Hemiptera of Quebec Province I am publishing this list of the species found by Professor LINDBERG.

Superfamily *Fulgoroidea* LATR.

Family *Cixiidae* SPIN.

Oliarus humilis SAY – 1 ♂, July 24–30, Quebec, Hudson Heights.

Cixius basalis VAN D. – 1 ♀, July 24–30, 2 ♀♀, August 25–31, Quebec, Hudson Heights; 1 ♀, August 1, W. Ontario, Sibley Park; 6 ♂♂ 8 ♀♀, August 1–15, W. Ontario, Black Sturg. Lake; 1 ♀, August 8, Ontario, pr. Garvel River.

C. pini FITCH – 31 ♂♂ 30 ♀♀, August 1–15, W. Ontario, Black Sturg. Lake; 1 ♂, August 23, Quebec, Lake Mt Tremblant. BEIRNE's (1950) investigation was consulted for the identification.

Family *Araeopidae* METC.

Laccocera vittipennis VAN D. – forma brachyptera: 25 ♂♂ 36 ♀♀, August 24–31, Quebec, Hudson Heights. -- forma macroptera: 1 ♂ 1 ♀, August 24–31, Quebec, Hudson Heights.

Pissonotus (Phyllodictus) aphidiooides (VAN D.) – forma brachyptera 1 ♂, August 25–31, Quebec, Hudson Heights.

P. (Ph.) basalis (VAN D.) – forma brachyptera: 4 ♀♀, July 24–30, Quebec, Hudson Heights; 2 ♂♂ 2 ♀♀, August 1–15, W. Ontario, Black Sturg. Lake.

P. (Ph.) tumidus MORGAN and BEAMER – forma brachyptera: 1 ♂, 1 ♀, August 1–15, W. Ontario, Black Sturg. Lake. — The types of the species were taken in Manitoba (MORGAN and BEAMER 1949 p. 103).

P. (Pissonotus) brunneus VAN D. – forma brachyptera: 1 ♂, August 25, Quebec, Choisy pr. Rigaud.

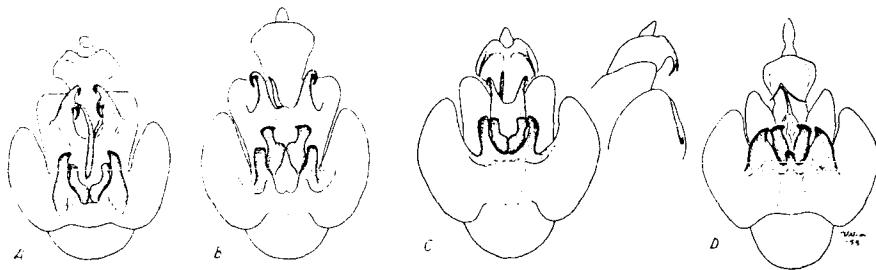

Abb. 1. Male genital capsule, ventral view, of *Megamelus aestus* Metc. (A), *davisii* VAN D. (B), *notula* GERM. (C), and *inflatus* METC. (D). — Orig.

Stenocranus pallidus BEAMER — 1 ♂, September 1–4, Quebec, Hudson Heights. — BEAMER'S (1946) material was from Illinois and Wisconsin.

Megamelus aestus METC. — forma brachyptera: 5 ♂♂ 8 ♀♀, August 25, Quebec, Choisy pr. Rigaud; 1 ♀, September 1–4, Quebec, Hudson Heights. — forma macroptera: 1 ♀, July 28, Quebec Choisy pr. Rigaud. — METCALF (1923, p. 203) mentions in the description of the species: »anal processes four. The anal segment of the species is without armature, however, and the formations mentioned are genital hooks belonging to the diaphragm (cf. Figs. 1 A and 2 A).

M. inflatus METC. — forma brachyptera: 3 ♂♂ 11 ♀♀, July 28, Quebec, Choisy pr. Rigaud. — forma macroptera: 2 ♂♂ 3 ♀♀, July 28, Quebec, Choisy pr. Rigaud. The genitals are shown in Figs. 1 D and 2 D.

M. davisii VAN D.? — forma macroptera: 1 ♂, August 1–15, W. Ontario, Black Sturg. Lake. The genitals are shown in Figs. 1 B and 2 B. OMAN (1947, p. 216) gave a picture of the genitals of the type of the species.

Species *M. notula* GERM. (VAN DUZEE 1917, p. 766; METCALF 1943, pp. 210–214) is mentioned of old from both Canada and the U.S. — MOORE (1950, p. 31) also mentions it from the Province of Quebec. The species is not included in the material collected by Professor Lindberg. The occurrence of *M. notula* in North America is still uncertain, in my opinion, for the species regarded by CRAWFORD (1914, p. 605, plate 47, Figs. I and J) and METCALF (1923, p. 169, plate 68, Fig. 648) as *notula* (»anal processes wanting», METCALF, l.c.) is not the same species as the *notula*, the genitals of which are shown in Figs. 1 C and 2 C (cf. CHINA 1938, p. 244, Fig. c; LINNAVUORI 1957, p. 50, Fig. G), studied by European investigators.

The question of the relationship of the genera *Delphax*, *Liburnia*, *Megamelus*, *Delphacodes* and *Callipypona* has been the subject of lively and extensive discussion (cf. for instance CRAWFORD 1914, pp. 602–604; MUIR and GIFFARD 1924, p. 18–19; OSSIANILSSON 1942, p. 113; METCALF 1943, p. 389–398; 1946, p. 63–64; CHINA 1954). I hold to the views put forward by DLABOLA (1957 a, p. 35; 1957 b, pp. 115–116) and LINNAVUORI (1957, pp. 49–50) and will call the following genus by the name *Callipypona* J. SAHLB. 1871 (*Liburnia* auct.

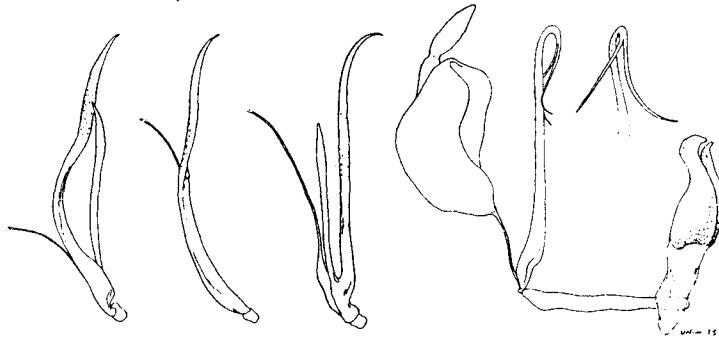

Abb. 2. Aedoeagus, lateral view, of *Megamelus aestus* METC. (A), *davisi* VAN D. (B), *notula* (C), and *inflatus* METC. (D). — Orig.

nec STÅL 1866, *Delphacodes* auct. nec FIEBER 1866). Type of the genus is *Delphax reyi* FIEB. 1866 == *Callipypona albicollis* J. SAHLB. 1871.

Callipypona analis (Crawf.) — forma brachyptera: 1 ♂, July 24 – 30, Quebec, Hudson Heights.
C. laminalis (VAN D.) — forma brachyptera: 1 ♂, August 25, Quebec, Choisy pr. Rigaud.
C. lineatipes (VAN D.) — forma brachyptera: 1 ♂, July 24 – 30, Quebec, Hudson Heights.
C. luteola (VAN D.) — forma brachyptera: 22 ♂♂ 40 ♀♀, July 24 – 30; 3 ♂♂ 14 ♀♀, August 25 – 31, 1 ♂ 1 ♀, September 1 – 4, Quebec, Hudson Heights. — forma macroptera: 1 ♀, July 24 – 30, Quebec, Hudson Heights.
C. paransera (BEAMER) — forma brachyptera: 1 ♂, August 1, W. Ontario, Sibley Park; 1 ♂, August 1 – 15, W. Ontario, Black Sturg. Lake. BEAMER (1948, pp. 101 – 102, plate VIII, Fig. 39) explained the species on the basis of material collected from the states of South Dakota and New York.
C. pellucida (F.) — forma macroptera: 2 ♂♂ 1 ♀, August 1 – 15, W. Ontario, Black Sturg. Lake.
C. puella (VAN D.) — forma macroptera: 1 ♂ 1 ♀, August 25, Quebec, Choisy pr. Rigaud.

Family Derbidae SPIN.

Otiocerus coquebertii KIRBY — 5 ♂♂ 4 ♀♀, August 1 – 15, W. Ontario, Black Sturg. Lake; 1 ♀, August 25 – 31, Quebec, Hudson Heights.
O. degenerii KIRBY — 2 ♂♂ 2 ♀♀, July 24 – 30, Quebec, Hudson Heights.
Cedusa incisa (METC.) — 31 ♂♂ 40 ♀♀ (2 couples copulating); July 24 – 30, 1 ♂ 1 ♀, August 25 – 31, Quebec, Hudson Heights; 2 ♀♀, August 25, Quebec Choisy pr. Rigaud. — Both METCALF (1923, pp. 165 – 166) and McATEE (1924) use the differences between the forms of genital styles to distinguish the species. A structurally intricate, asymmetrical aedoeagus would obviously also constitute a good characteristic of species in this genus.

Family Dictyopharidae SPIN.

Scolops sulcipes SAY — forma brachyptera: 22 ♂♂ 19 ♀♀ (2 ♀♀ with a tubular deformity in the genitals), August 25 – 31, Quebec, Hudson Heights; 1 ♂, August 25, Quebec, Choisy pr. Rigaud; 2 ♀♀, August 28, Quebec, La Minerve. — forma macroptera: 7 ♂♂ 7 ♀♀, August 25 – 31, Quebec, Hudson Heights.

Two brachypterous females had a tubular deformity (cf. Fig. 3 b) in the thin chitinous membrane between the divided 8th (cf. BREAKY 1928, p. 419) and 7th sternites. The deformity resembles exactly the formations which I have

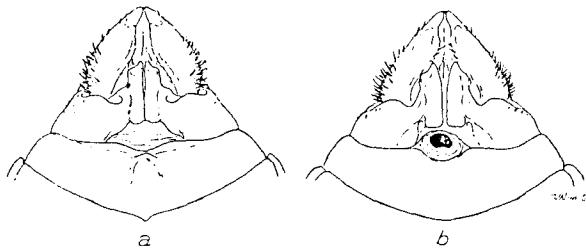

Abb. 3. *Scolops sulcipes* (SAY). Female genital capsule, ventral view, normal (a), deformed (b). — Orig.

previously (KONTKANEN 1950) found in a Finnish material in some euscelid leafhoppers (6 species) and which DLABOLA (1957 c) recently reported in the species *Rhopalopyx parvispinus* WAGN. in Czechoslovakia.

In all these cases the deformity was associated with pronounced atrophy of the genitals. I assumed in my article that the deformed individuals were males. It is obvious from the illustrations by DLABOLA that they were females.

These two *Scolops sulcipes* individuals from Hudson Heights are the first fulgorids in which I have seen the deformity in question. In this case I could not observe any atrophy of the external genitals or any other deformity.

It can readily be assumed that the deformity in question is caused by a parasite. So far, however, neither DLABOLA nor I have been able to find the causative agent and the question still awaits detailed study.

Family Achilidae STÅL.

Epiptera confusa BEIRNE — 2 ♀♀, August 1–15, W. Ontario, Black Sturg. Lake.
E. pallida (SAY) — 1 ♀, August 1–15, W. Ontario, Black Sturg. Lake.

Family Flatidae SPIN.

Ormenis septentrionalis SPIN. — 1 ♂, August 25–31, Quebec, Hudson Heights.

Family Issidae SPIN.

Bruchomorpha oculata NEWM. — forma brachyptera: 7 ♂♂ (1 dryinised) 6 ♀♀, August 25–31; 2 ♀♀, September 1–4, Quebec, Hudson Heights; 1 ♂ 2 ♀♀, August 28, Quebec, La Minerve; 2 ♂♂ 1 ♀, August 29, Quebec, Lake Mt. Tremblant. — forma macroptera: 3 ♀♀, August 25–31, Quebec, Hudson Heights.

Aphelonema histrionica STÅL — forma brachyptera: 20 ♂♂ (1 dryinised) 16 ♀♀ (1 dryinised), August 1–15, W. Ontario, Black Sturg. Lake; 1 ♀ August 28, Quebec, La Minerve. I met dryinide larvae in these two Issidae species only. The larvae were attached to the apical part of abdomen, on the dorsal side.

Kirjallisuutta.

A. E. GARDNER: A key to the larvae of the British Odonata. Entom. Gazette 5, s. 157 – 171 ja 193 – 213. Feltham 1954.

Tämä pieni, myös erillisenä vihkosena saatavissa oleva tutkielma sisältää kaavat sudenkorennottoukkien määritystä varten. Tässä suhteessa meikäläinen kylläkin kutakuinkin tulee toimeen VALLEN käsikirjan (*Animalia Fennica* 7) avulla. Kuitenkin on aihetta suostella sen lisänä käyttöön yllämainittua kirjoitelmia. Muutamia Suomessa esiintyvistä lajeista siitä tosin puuttuu, mutta kuvitus on runsas, mikä tämän alan teoksissa on tärkeää. Habitus-ja detaljiirrokset, joita on 118, ovat kookkaita ja tarkkaa työtä. Erityisesti niiden ansiosta toukkien nimeäminen käy vaivattomasti. Kirjallisuusluettelo, joka käsittää 78 numeroa, lienee ainutlaatuinen.

Lehdemiinaajat muodostavat biologisen ryhmän, jolle toukan elintavan ohella ja siihen liittyen pieni koko on tunnusomaisena piirteenä. Tästä, sekä samalla useimpien lehtimiinojen heikosta havaittavuudesta on epäilemättä johtunut, että ryhmä aikaisemmin oli, esim.
