

SHORT COMMUNICATION

Bull. zool. Surv. India, 2 (1) : 99-100, 1979

ON *EOEURYSIA FLAVOCAPITATA* MUIR (HOMOPTERA :  
DELPHACIDAE) FROM INDIA

Distant (1906-1917) made a salient contribution on Indian Delphacidae approximately consisted of 94 species which pertain to 15 genera. Muir in 1921 revised and synonymised a fraction of Distant's record on genera and species. The incidence of *Eoeurysia flavocapitata* Muir on sugarcane is not yet reported as a pest of major economic importance. The species is recorded from Malaya, South

China, Krakatna (East Indies) and India. Muir (1913) being an original author of his new genus *Eoeurysia*, subsequently designated the type-species *E. flavocapitata* in 1915.

The objective of this paper is to supplement genital armature with illustration as key characteristics which remained omitted by Muir (1913) and Mammen and Menon (1974).

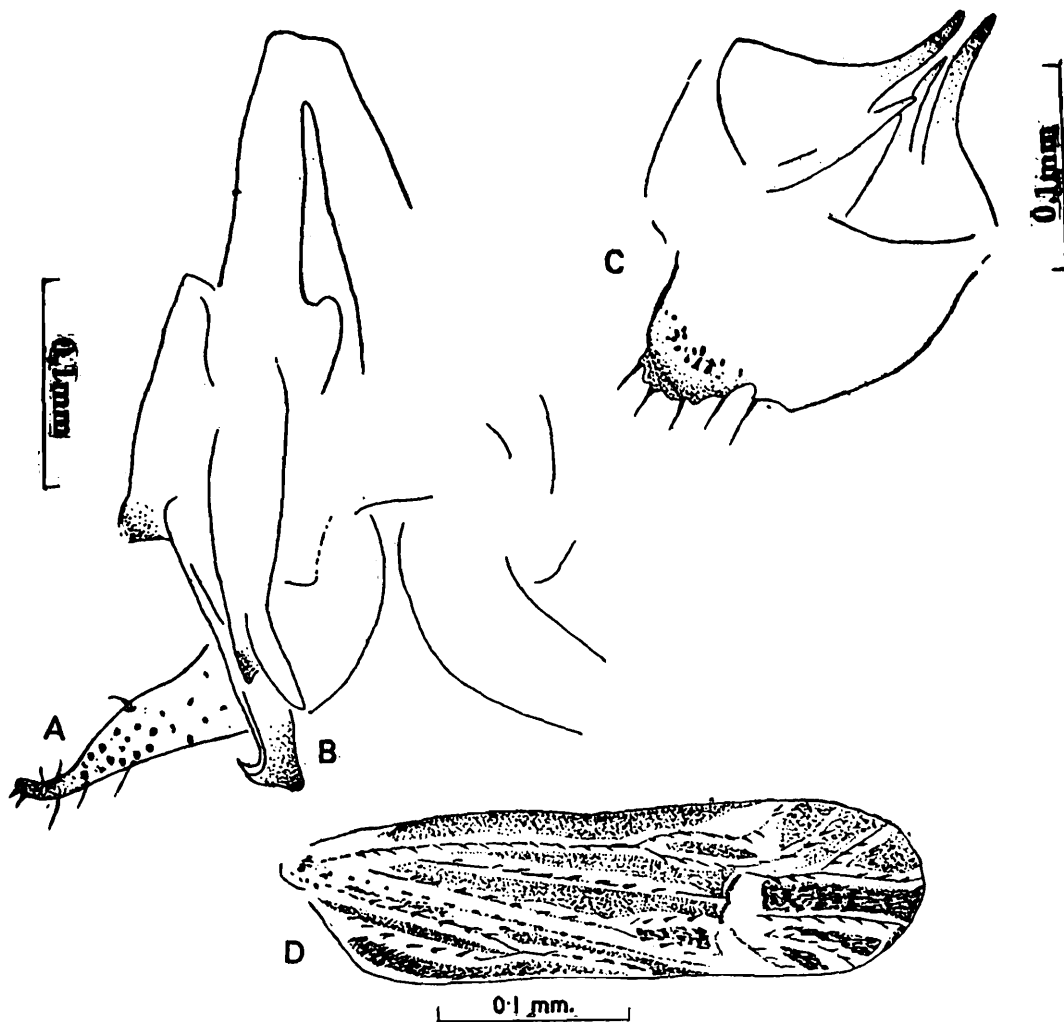

Fig. 1. *Eoeurysia flavocapitata* Muir, A-Aedeagus ; B-Genital style ; C-Anal lobe ; D-Tegmina.
